TRAINING OUR FUTURE WORKFORCE:
OUR COMMITMENT TO CLEAN ENERGY

The nature of energy is changing, and with it comes new and specialized technologies. Whether it is solar and wind power or hydropower and geothermal energy, new infrastructure is required to support these technologies creating a need for skilled workers who can install and maintain these systems.

WIND POWER

SOLAR POWER

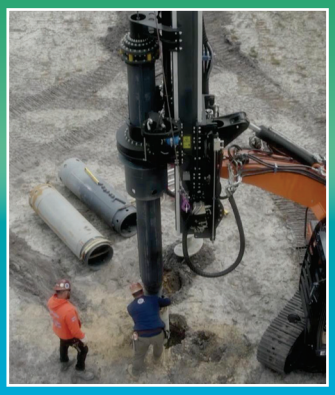
HYDROPOWER

GEOTHERMAL POWER

Union contractors and skilled trades people are taking the lead to meet this demand. With expertise in all phases of building and construction, they hold a prominent position in the handling and installation of solar panels, wind turbines and other clean energy technology. They are also leaders in apprenticeship training to meet the demands of these new systems. As a result, our members have the skill, experience and training to meet our future clean energy needs.

The Carpenters Union houses several crafts essential to the renewable energy sector. From piledrivers to underwater welders and from concrete specialists to millwrights, it takes precision to make our energy sector go green.

Members and their contractor partners understand that renewable energy is the future. Knowing this, we have invested and allocated resources to focus on training the next generation of workers.



We have achieved this by opening a Dive School, Global Wind Organization Training and dedicating our South Jersey Training Center to infrastructure initiatives.
